MISSION STATEMENT

Nursing Outlook, the official journal of the American Academy of Nursing, provides critical and timely analyses of emerging professional and health care issues of importance to all nurses. The primarily editorial goals of the Journal are to:

1. Publish innovative, original articles that stimulate thoughtful discussion and scholarly debate and policy implications among nurses and other health care professionals.
2. Inform readers about the diversity of opinion on controversial professional and health care and health policy matters affecting nursing and the health of the public.
3. Provide a multidisciplinary forum for the dissemination of information derived from the synthesis of extant knowledge of current and future clinical practice and health policy alternatives.
4. Disseminate information about creative, alternative, and forward-looking models of education and clinical practice as they relate to changing systems of health care.
5. Promote the synthesis and use of scientific knowledge in a timely fashion by nurses and other health care professionals to enhance the quality and efficiency of health care.
6. Provide the American Academy of Nursing with a medium for communicating important policy issues and organizational activities.
7. Increase critical awareness of technologies, products, and services that have the potential for increasing the effectiveness of nurses in all settings.
